General

Firmware version

For a given firmware tag **VXY-ZK**:

- ❖ Usercode is **XYZKdbdb**
- ❖ Firmware version read via "R 4200" is **XYZK**

VME access through the board discrete "emergency" logic

The FPGA may be accessed via JTAG through the discrete logic as follows

- ❖ The VME address is 0xFFFC
- ❖ The bit 0 of the data sent is TMS
- ❖ The bit 1 of the data sent is TDI

For example, to read the Usercode, starting from JTAG idle (five TMS = 1 & one TMS = 0), the commands are:

```

W FFFC 1 To Select-DR-Scan
W FFFC 1 To Select-IR-Scan
W FFFC 0 To Capture-IR
W FFFC 0 To Shift-IR

W FFFC 0 Shifting IR (Read UserCode IR = 3C8)
W FFFC 0 Shifting IR
W FFFC 0 Shifting IR
W FFFC 2 Shifting IR
W FFFC 0 Shifting IR
W FFFC 0 Shifting IR
W FFFC 2 Shifting IR
W FFFC 2 Shifting IR
W FFFC 2 Shifting IR
W FFFC 3 Shifting IR and to Exit1-IR

W FFFC 1 To Update-IR
W FFFC 0 To Run_Test/Idle
W FFFC 1 To Select-DR-Scan
W FFFC 0 To Capture-DR

W FFFC 0 Shifting DR
R FFFC 0 Shifting DR (Read bit 0 of UserCode)

```

Since the Usercode register is 32 bits, the last two commands should be repeated 31 more times.

Translation into temperatures, current, and voltages

The output of the 7YZ0 commands is a 12-bit number that we call R_{YZ} . The measurement is:

- The FPGA temperature is $T_{\text{FPGA}} = \frac{R_{00} \times 503.975}{4096} - 273.15$ [° C]
- The PPIB current is $I_{\text{PPIB}} = \frac{R_{12} \times 5000}{4096} - 10$ [mA]
- The temperature of the thermistors THERM1, THERM2 is given by

R_{XY}	377	455	55A	687	7DD	959	AF8	CB5	E87	FFF
T [° C]	15	20	25	30	35	40	45	50	55	60

- The voltage levels are $V_{YZ} = \frac{R_{YZ}}{2048} \times V_{YZ, \text{Nom}}$ [V], where $V_{YZ, \text{Nom}}$ is the nominal voltage level for that register. That is, $V_{10, \text{Nom}} = 3.3\text{V}$, $V_{13, \text{Nom}} = 3.6\text{V}$, $V_{11, \text{Nom}} = V_{17, \text{Nom}} = 5\text{V}$, $V_{14, \text{Nom}} = 2.5\text{V}$, and $V_{16, \text{Nom}} = 1\text{V}$.
