Physics 24 Problem Set 7

Harry Nelson

due Monday, February 27

Please make your work neat, clear, and easy to follow. It is hard to grade sloppy work accurately. Generally, make a clear diagram, and label quantities. Derive symbolic answers, and then plug in numbers after a symbolic answer is available.

1. A current of 250 mA flows in an infinitely long straight wire, of negligible cross-sectional area.
   
   (a) Express the current in the wire in esu/second.

   (b) Determine the magnetic field 1 cm from the wire in gauss, using Equation (3) on page 208 of your text.

   (c) Determine the magnetic field 1 cm from the wire in tesla, using SI/MKS units, using Equation (3′) on page 211 of your text.

   (d) One esu of charge is moving at a speed of \( v = 2 \times 10^{10} \text{ cm/s} \), parallel to the wire, but 1 cm away. What force does the charge feel?

   (e) Repeat the last part, but do the problem using all SI/MKS units.

   (f) A second wire, infinitely long, is placed parallel to the first, 1 cm away. Its current flows in the direction opposite to the first, but has the same magnitude. Evaluate the force on 10 cm of this wire, using all Gaussian/CGS units.

   (g) Repeat the last part, using SI/MKS units.

2. Purcell, Problem 6.1

3. Purcell, Problem 6.2

4. Purcell, Problem 6.3

5. Purcell, Problem 6.5
